

# Factsheet: PASTA indicator set

## Why an indicator set?

The PASTA project has developed an indicator set to help understand active mobility (AM) and the conditions which support or constrain it in a city. A better understanding of framework conditions and their relations can help decision makers to choose the most appropriate packages of measures to increase AM in their city. Within the 7 PASTA cities, the indicators also provide data and context to support analysis of the longitudinal study.

## Selection of indicators

A set of both qualitative and quantitative indicators were selected based on an extensive literature search and a European workshop. The indicators were selected based on them being valid, clear and feasible to collect. They were split into four categories; City Profile Factors, Enablers, Transport System & Services, and Results & Impacts.

A short description for each indicator, the purpose of the indicator (why it is useful with regard to AM), details on the information that needs to be collected and references to further information can be found in the pdf report [here](#).

## Data collection in the 7 cities

In the 7 PASTA cities, the data for the indicator set was collected by searching publically available data online and in different documents. Some data was collected directly from city representatives through interviews and in expert workshops.

## Practical implications

The indicator set can be used by planners and decision makers to understand the current situation in the city. The information helps to identify areas to be improved or to design measures to get the best possible effect under different framework conditions. The relations between indicators in the 7 cities are described and analysed in the PASTA project. You can try this for yourself using the spreadsheet [here](#).

More information on the PASTA Indicator set can be found at: [pastaproject.se/about-pasta/indicator-set/](http://pastaproject.se/about-pasta/indicator-set/)
